Poder e Tamanho Amostral em alguns Testes de Hipótese Não Paramétricos

Lucas Lima Ayres

Orientador: Prof. Thiago Rezende dos Santos

Universidade Federal de Minas Gerais

24 de novembro de 2017

Introdução

- O problema da indução
- Testes de hipótese: a abordagem de Neyman-Pearson
- Vantagens dos testes não paramétricos
- Dimensionamento amostral n\u00e3o param\u00e9trico: escassez de informa\u00e7\u00f3es ao p\u00fablico
- Teste de aderência do qui-quadrado (Pearson, 1900)
- Teste dos postos sinalizados de Wilcoxon (Wilcoxon, 1945)
- 3 Teste da soma dos postos de Wilcoxon (Wilcoxon, 1945)
- Teste de Kruskal-Wallis (Kruskal e Wallis, 1952)

- Considere-se uma dist. multinomial (n, \mathbf{p}) .
- Testa-se H_0 : $\mathbf{p} = \mathbf{p_0}$ contra H_1 : $\mathbf{p} \neq \mathbf{p_0}$.
- Estatística-teste: $Q = \sum_{i=1}^{k} \frac{(O_i np_{0i})^2}{np_{0i}}$.
- Sob H_0 , $Q_n \xrightarrow{d} \chi^2_{k-1}$. Sob H_1 , $Q_n \xrightarrow{d} \chi'^2_{k-1,\lambda}$, onde $\lambda = n \sum_{i=1}^k \frac{(p_{1i} - p_{0i})^2}{p_{0i}}$.
- Região crítica: $\left[\chi^2_{1-\alpha,k-1},+\infty\right)$.
- Poder: P_{H_1} $(Q \ge \chi^2_{1-\alpha,k-1})$.
- Encontrar λ tal que $\chi^2_{1-\alpha,k-1} = \chi'^2_{\beta,k-1,\lambda}$. (Calcular a raiz da eq. $\chi^2_{1-\alpha,k-1} \chi'^2_{\beta,k-1,\lambda} = 0$.)
- Conhecido o valor de λ , determina-se o tamanho amostral: $n = \lambda \left[\sum_{i=1}^{k} \frac{(p_{1i} p_{0i})^2}{p_{0i}} \right]^{-1}.$

Exemplo (fábrica de dados)

Para aferir se há algum desvio relevante da hipótese de equiprobabilidade das faces, quantos dados precisam ser lançados? A hipótese nula será testada através do teste do qui-quadrado para $\alpha=0.01$ e $\beta=0.05$. O tamanho do efeito igual a 0.1 representa o desvio máximo tolerável.

```

Report Definitions

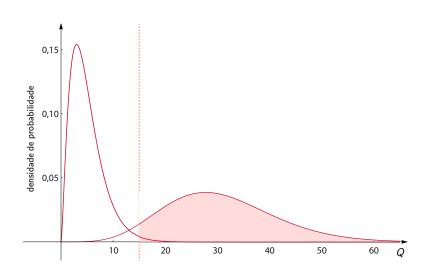

Power is the probability of rejecting a false null hypothesis. It should be close to one. N is the size of the sample drawn from the population. To conserve resources, it should be small. W is the effect size--a measure of the magnitude of the Chi-Square that is to be detected. DF is the degrees of freedom of the Chi-Square distribution. Alpha is the probability of rejecting a true null hypothesis. Beta is the probability of accepting a false null hypothesis.

Summary Statements

A sample size of 2577 achieves 95% power to detect an effect size (W) of 0.1000 using a 5 degrees of freedom Chi-Square Test with a significance level (alpha) of 0,01000.

Design Tab Solve For:

Sample Size DF (Degrees of Freedom): Power: 0.95 Alpha: 0.01 W (Effect Size): 0.1

- Seja X uma v.a. contínua cuja dist. é simétrica em torno de uma constante μ.
- Testa-se $\mu = 0$ contra $\mu > 0$.
- Estatística-teste: $T^+ = \sum_{i=1}^n R_i \psi_i$, onde R_i é o posto de $|X_i|$, $\psi_i = \begin{cases} 1, & \text{se } X_i > 0, \\ 0, & \text{c.c.} \end{cases}$
- Sob H_0 , $\frac{T_n^+ E_{H_0}(T_n^+)}{\sqrt{\text{Var}_{H_0}(T_n^+)}} \xrightarrow{d} N(0, 1)$. Sob H_1 , $\frac{T_n^+ - E_{H_1}(T_n^+)}{\sqrt{\text{Var}_{H_0}(T_n^+)}} \xrightarrow{d} N(0, 1)$.
- Região crítica: $\left[\frac{n(n+1)}{4} + z_{1-\alpha}\sqrt{\frac{n(n+1)(2n+1)}{24}}, +\infty\right)$.
- Poder: $P_{H_1}\left(\frac{T^+ E_{H_1}(T^+)}{\sqrt{\mathsf{Var}_{H_1}(T^+)}} \ge \frac{\frac{n(n+1)}{4} + z_{1-\alpha}\sqrt{\frac{n(n+1)(2n+1)}{24}} E_{H_1}(T^+)}{\sqrt{\mathsf{Var}_{H_1}(T^+)}}\right)$.

- Achar *n* tal que $\frac{\frac{n(n+1)}{4} + z_{1-\alpha} \sqrt{\frac{n(n+1)(2n+1)}{24} E_{H_1}(T^+)}}{\sqrt{Var_{H_1}(T^+)}} = z_{\beta}.$
- $E(T^+)=n\Big[p_1+\frac{(n-1)}{2}p_2\Big],$ $Var(T^+)=n\Big\{p_1(1-p_1)+(n-1)\Big[(p_1-p_2)^2+\frac{3}{2}p_2(1-p_2)+(n-2)\Big(p_3-p_2^2\Big)\Big]\Big\},$ onde $p_1=P(X_i>0),\ p_2=P\Big(X_i+X_j>0\Big),\ p_3=P\Big(X_i+X_j>0\cap X_i+X_k>0\Big).$
- Calcular a raiz da equação

$$\left\{ \begin{array}{l} \frac{n(n+1)}{4} + z_{1-\alpha} \sqrt{\frac{n(n+1)(2n+1)}{24}} - n \left[p_1 + \frac{(n-1)}{2} p_2 \right] \\ \\ - z_{\beta} \sqrt{np_1(1-p_1) + \frac{n(n-1)}{2} \left[2 \left(p_1 - p_2 \right)^2 + 3 p_2 \left(1 - p_2 \right) \right] + n(n-1)(n-2) \left(p_3 - p_2^2 \right)} \end{array} \right\} = 0.$$

Exemplo (dist. uniforme)

Determinar o tamanho da amostra para testar $H_0: \mu=0$ contra $H_1: \mu \neq 0$ com $\alpha=0,1, \ \beta=0,2,$ quando o mecanismo gerador das observações é a v.a. uniforme (-0,3;0,7).

$$X \sim \text{uniforme}(-0,3;0,7)$$

$$p_{1} = P(X > 0) = \int_{0}^{0,7} dx = 0,7$$

$$p_{2} = P(X_{1} + X_{2} > 0) = \int_{-0,3}^{0,3} \int_{-x_{1}}^{0,7} dx_{2} dx_{1} + \int_{0,3}^{0,7} \int_{-0,3}^{0,7} dx_{2} dx_{1} = 0,82$$

$$p_{3} = P(X_{1} + X_{2} > 0 \cap X_{1} + X_{3} > 0)$$

$$= \int_{0,3}^{0,7} \int_{-0,3}^{0,7} \int_{-0,3}^{0,7} dx_{3} dx_{2} dx_{1} + \int_{-0,3}^{0,3} \int_{-x_{1}}^{0,7} \int_{-x_{1}}^{0,7} dx_{3} dx_{2} dx_{1} = 0,712$$

```

Report Definitions

Power is the probability of rejecting a false null hypothesis.

N is the size of the sample drawn from the population.

Mean0 is the value of the mean assuming the null hypothesis. This is the value being tested.

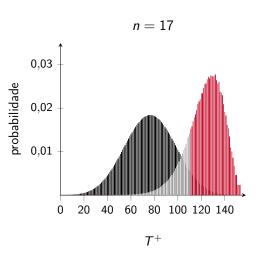

Mean1 is the actual value of the mean. The procedure tests whether Mean0 = Mean1.

Target Alpha is the probability of rejecting a true null hypothesis. It is set by the user.

Actual Alpha is the alpha level that was actually achieved by the experiment.

Actual Alpha is the alpha level that was actually achieved by the experiment.

Beta is the probability of accepting a false null hypothesis.

 $1 - \beta = 0.812474852925232$

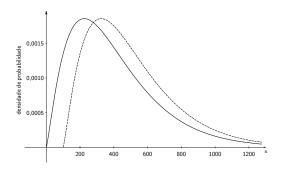

- Sejam X e Y v.as contínuas e independentes tais que $Y \stackrel{d}{=} X + \Delta$.
- Testa-se $H_0: \Delta = 0$ contra $H_1: \Delta > 0$.
- Estatística-teste: $T = \sum_{i=1}^{n} R_i$, onde R_i é o posto de y_i .
- Sob H_0 , $\frac{T_{\min(m,n)} E_{H_0}(T_{\min(m,n)})}{\sqrt{\text{Var}_{H_0}(T_{\min(m,n)})}} \xrightarrow{d} N(0,1)$. Sob H_1 , $\frac{T_{\min(m,n)} - E_{H_1}(T_{\min(m,n)})}{\sqrt{\text{Var}_{H_1}(T_{\min(m,n)})}} \xrightarrow{d} N(0,1)$.
- Região crítica: $\left[\frac{n(m+n+1)}{2} + z_{1-\alpha}\sqrt{\frac{mn(m+n+1)}{12}}, +\infty\right)$.
- Poder: $P_{H_1}\left(\frac{T E_{H_1}(T)}{\sqrt{\mathsf{Var}(T)}} \ge \frac{\frac{n(m+n+1)}{2} + z_{1-\alpha}\sqrt{\frac{mn(m+n+1)}{12}} E_{H_1}(T)}{\sqrt{\mathsf{Var}_{H_1}(T)}}\right)$.

- Achar *n* tal que $\frac{\frac{n(m+n+1)}{2} + z_{1-\alpha} \sqrt{\frac{mn(m+n+1)}{12} E_{H_1}(T)}}{\sqrt{\text{Var}_{H_1}(T)}} = z_{\beta}.$
- $E(T) = mnp_1 + \frac{n(n+1)}{2}$, $Var(T) = mn[p_1(1-p_1) + (n-1)(p_2-p_1^2) + (n-1)(p_3-p_1^2)]$, onde $p_1 = P(X_i < Y_j)$, $p_2 = P(X_i < Y_j \cap X_i < Y_k)$, $p_3 = P(X_i < Y_j \cap X_k < Y_j)$.
- Calcular a raiz da equação

$$\left\{ \begin{array}{l} \frac{n(an+n+1)}{2} + z_{1-\alpha} \sqrt{\frac{an^2(an+n+1)}{12}} - an^2 p_1 - \frac{n(n+1)}{2} \\ \\ - z_{\beta} \sqrt{an^2 \left[p_1 (1-p_1) + (n-1) \left(p_2 - p_1^2 \right) + (an-1) \left(p_3 - p_1^2 \right) \right]} \end{array} \right\} = 0.$$

Exemplo (dist. gama)

Considerem-se $X \sim \Gamma(9,25;180)$ e $Y \stackrel{d}{=} X + 100$. Determinar o tamanho da amostra para testar $H_0: \Delta = 0$ contra $H_1: \Delta > 0$ com $\alpha = 0,05$ e $\beta = 0,1$.

$$X \sim \Gamma(2,25;180)$$

$$Y \stackrel{d}{=} X + 100$$

$$p_1 = P(X < Y) = \int_{100}^{\infty} \int_{0}^{y} f_{XY}(x,y) dx dy \approx 0,623$$

$$W = \min(Y_1, Y_2)$$

$$p_2 = P(X_1 < Y_1 \cap X_1 < Y_2) = P(X < W) = \int_{100}^{\infty} \int_{0}^{w} f_{XW}(x,w) dx dw$$

$$\approx 0,485$$

$$Z = \max(X_1, X_2)$$

$$p_3 = P(X_i < Y_j \cap X_k < Y_j) = P(Z < Y) = \int_{100}^{\infty} \int_{0}^{y} f_{ZY}(z,y) dz dy$$

$$\approx 0,447$$

Report Definitions

Power is the probability of rejecting a false null hypothesis.

N1 is the size of the sample drawn from population 1.

N2 is the size of the sample drawn from population 2.

Diff0 is the mean difference between (Grp1 - Grp2) assuming the null hypothesis. H0.

Diff1 is the mean difference between (Grp1 - Grp2) assuming the alternative hypothesis, H1.

Target Alpha is the probability of rejecting a true null hypothesis. It is set by the user.

- Seja X uma v.a. contínua e $X_i \stackrel{d}{=} X + \Delta_i$ uma translação dela.
- Testa-se $H_0: \Delta_1 = \Delta_2 = \cdots = \Delta_k$ contra $H_1: \neg H_0$.
- Estatística-teste: $H = \frac{12}{n(n+1)} \sum_{i=1}^{k} \sum_{j=1}^{n_i} \frac{R_{ij}^2}{n_i} 3(n+1)$, onde R_{ij} é o posto da observação x_{ij} .
- Sob H_0 , $H_{\min(n_1,...,n_k)} \xrightarrow{d} \chi_{k-1}^2$. Sob H_1 , $H_{\min(n_1,...,n_k)} \xrightarrow{d} \chi_{k-1,\lambda}'^2$, onde $\lambda = 12n \left[\int_{-\infty}^{\infty} f_X(x)^2 dx \right]^2 \sum_{i=1}^k \frac{n_i}{n} \left(\Delta_i - \bar{\Delta} \right)^2$.
- Região crítica: $\left[\chi^2_{1-\alpha,k-1},+\infty\right)$.
- Poder: $P_{H_1} (H \ge \chi^2_{1-\alpha,k-1})$.
- Encontrar λ tal que $\chi^2_{1-\alpha,k-1} = \chi'^2_{\beta,k-1,\lambda}$. (Calcular a raiz da eq. $\chi^2_{1-\alpha,k-1} \chi'^2_{\beta,k-1,\lambda} = 0$.)
- Conhecido o valor de λ , determina-se o tamanho amostral: $n = \lambda \left[12 \int_{-\infty}^{\infty} f_X(x)^2 dx \sum_{i=1}^k a_i \left(\Delta_i \bar{\Delta} \right)^2 \right]^{-1}.$

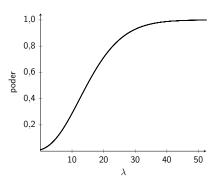

Exemplo (conscrição lotérica)

A tabela a seguir mostra o resultado de um sorteio realizado para definir a ordem de convocação de homens para uma guerra. Aplicando-se o teste de Kruskal-Wallis aos meses do ano, a hipótese nula é rejeitada ao nível de significância de 0,01. Fazer o gráfico do poder do teste como função do parâmetro λ .

No R:

```
> lambda <- seq(0, 50, length = 5000)
> poder <- pchisq(qchisq(1 - 0.01, df = 11), df = 11,
ncp = lambda, lower.tail = FALSE)
> plot(lambda, poder, cex = 0.01)
```

Conclusão

- Os métodos apresentados são computacionalmente menos exigentes que os de simulação.
- Alguns elementos do input podem ser difíceis para o utilizador.
- Em um dos exemplos, a função wilcox.test.pss mostrou-se adequada mesmo para uma amostra pequena.
- A fórmula de Noether (1987) produziu resultados diferentes nos exemplos relacionados aos testes de Wilcoxon.
- O método da eficiência relativa assintótica subestimou o tamanho da amostra em um dos exemplos.
- Sugestões de investigação:
 - testes de Friedman, de Cochran, de Jonckheere-Terpstra;
 - admitir a possibilidade de empates;
 - tamanho do efeito para o Teste de Kruskal-Wallis.
